URINARY INCONTINENCE PAD**Background of the Invention**

This invention relates to the field of devices or appliances used to relieve or mitigate the problems associated with human urinary incontinence. More specifically, the present invention relates to a removable external closure for the human female urethra.

Urinary incontinence, due to disease, injury, or other causes, is a troublesome problem for many individuals. Surgical intervention is often required to treat severe cases of incontinence, but in those cases where the patient suffers from only a partial loss of bladder control, or where the patient is otherwise a poor candidate for surgery, nonsurgical treatment is called for. Such nonsurgical approaches are particularly appropriate for female patients who suffer from the partial, sporadic loss of bladder control sometimes referred to as "stress incontinence" or "urge incontinence". Such stress or urge incontinence, in fact, is the most common cause of urine loss in adult women.

Nonsurgical management of female urinary incontinence includes non-therapeutic management, wherein the patient wears an appliance or device proximate the urethral orifice ("meatus") that collects or captures urinary discharge. Such devices fall generally into two categories: (1) urine collection devices, and (2) absorbent pads.

Urine collection devices typically comprise a receiving orifice or receptacle for capturing urine flowing from the urethra; retention means, associated with the receptacle or orifice, for holding the receptacle or orifice in the proximity of the urethral meatus; and means

for directing urine from the receptacle or orifice to a reservoir or a container or the like for disposal. Devices of this general description are disclosed in the following U.S. Patents: 3,512,185 - Ellis; 3,661,155 -
5 Lindan; 4,412,511 - Steer et al.; 4,457,314 - Knowles; 4,484,917 - Blackmon; 4,690,677 - Erb; 4,822,347 - MacDougall; and 4,846,819 - Welch. A variation on the urinary collection device theme is the "female external catheter", disclosed in U.S. Patent No. 4,563,183 -
10 Barrodale et al., which includes a catheter tube having one end inserted into the urethra. In many of these devices, the retention means are configured so as to be inserted into the interlabial space, being retained therein by the anatomical structure of the external female
15 genitalia. The Blackmon and MacDougall devices also use an adhesive to assist in retention.

The category of absorbent pads includes a wide variety of devices which generally comprise a body of absorbent material configured so as to be insertable into
20 the interlabial space, and retained therein by the anatomical structure of the external female genitalia. Such devices typically resemble (and, indeed, can function as) catamenial sanitary napkins. The following U.S. Patents disclose devices that may generally be considered
25 within this category: 3,983,873 - Hirschman; 4,595,392 - Johnson et al.; 4,627,848 - Lassen et al.; 4,673,403 - Lassen et al.; 4,743,245 - Lassen et al.; 4,804,380 - Lassen et al.; and 4,846,824 - Lassen et al. A sanitary napkin that is configured for interlabial retention, and
30 that could be used to capture and absorb urine flow, is disclosed in British Patent No. 754,481.

While the above-described devices are useful in certain applications, they are subject to a number of

disadvantages. For example, the urine collection devices require the user to wear a reservoir or container that may be prone to overflow or spillage. Also, such devices are better suited to users who suffer from chronic or severe
5 loss of bladder function, rather than those who suffer only from moderate stress or urge incontinence. The absorbent pads tend to be bulky, and may be uncomfortable for some users, especially when wet. Odor associated with urine collection devices is often noticeable by others,
10 and is therefore undesirable.

Use of the prior art devices described above is based upon the assumption that the flow of urine out of the urethra cannot or should not be stopped. This assumption may not be true in many cases of stress or urge
15 incontinence, which are transient in nature. In such cases, external occlusion of the urethral meatus may provide an adequate degree of continence for many patients, but this approach has been overlooked, at least for the most part, by the prior art.

20 There is, therefore, a need for a device that provides for the effective management of female stress or urge incontinence by means of the external occlusion of the urethral meatus; that is easy to use and comfortable to wear; and that provides for secure retention with good
25 sealing qualities.

Summary of the Invention

Broadly, the present invention is a urethral meatus occlusion device, comprising a resilient body, configured to engage and seal against the urethral meatus, and to be
30 retained in place by engagement with the anatomical structure of the external female genitalia. More specifically, in one preferred embodiment, the body is a pad that includes a base, having a substantially

triangular or arrowhead-shaped outline, that is adapted to seat against the vestibule of the vulva, anteriorly of the vaginal orifice, thereby occluding the urethral meatus. The lateral edges of the pad are configured to fit inside
5 the labia minora, the engagement between the pad and the labia thereby retaining the pad firmly against the vestibule, in sealing engagement against the meatus. The side of the pad opposite the base is configured with a central longitudinal ridge that, when the pad is installed
10 in the vestibule, extends into the interlabial space. A loop of thread may be inserted through the ridge to facilitate removal of the device, or a finger hole may be provided into the posterior of the ridge for the same purpose.

15 In a second preferred embodiment of the invention, the pad has a substantially tubular configuration, and thus lacks the lateral edges or "wings" of the first preferred embodiment. This "wingless" embodiment is adapted for use where the floor of the vestibule is
20 narrower than what may be considered "normal". As with the first preferred embodiment, the pad seats against the floor of the vestibule, anteriorly of the vaginal orifice, thereby occluding the urethral meatus. The tubular portion of the pad is configured to fit inside the labia
25 minora, the engagement between the pad and the labia thereby retaining the pad firmly against the vestibule, in sealing engagement against the meatus. The side of the pad opposite the base is configured with a central longitudinal ridge that, when the pad is installed in the
30 vestibule, extends into the interlabial space, thereby facilitating insertion and removal.

In both of the aforementioned embodiments, at least that portion of the pad that lies in sealing engagement

against the meatus is coated with a pressure-sensitive, hydrophilic hydrogel adhesive for retention against the vestibule. The adhesive, in concert with the resilient pad, spreads to fill the interlabial space proximate the vestibule, thereby providing a conformal fit with the anatomical structure, which enhances the retention of the device. The pad itself can be coated or impregnated with a suitable anti-bacterial or germicidal agent to inhibit infection.

10 In a third preferred embodiment of the invention, the body comprises an elastomeric bladder or sac, filled with a soft, compliant, biocompatible gel or liquid, and coated with a pressure-sensitive hydrophilic hydrogel adhesive, to enhance retention. The gel-filled sac spreads within
15 the interlabial space to conform closely to the anatomic structure of the external female genitalia, and thereby seals against the urethral meatus, with the aid of the adhesive.

It will be appreciated that the present invention
20 offers a new and advantageous approach to the management of stress and urge incontinence. For example, the device is small, unobtrusive, easy to use, and comfortable wear. By allowing the user effectively to retain urine, the device avoids the problems associated with prior art
25 devices, enumerated above, that allow the discharge of urine. The device can be made in a variety of sizes and shapes for optimal fit for each individual user. The device is economical to manufacture, and can, therefore, be a disposable item.

30 These and other advantages will be better appreciated from the detailed description that follows.

30 Detailed Description of the Invention

Referring first to Figures 1 through 4 of the drawings, a female urinary incontinence device 10, in accordance with a first preferred embodiment of the

present invention, is shown. The device comprises a body or pad 12, formed of a resilient foam material that is biocompatible. One suitable class of materials is that of foams formed from the water actuation of prepolymers based on either toluene diisocyanate (TDI) or methylene diphenyl diisocyanate (MDI). Such prepolymers are marketed by W. R. Grace & Co.-Conn., Organic Chemicals Division, Lexington, Massachusetts, under the trademarks "HYPOL" (TDI) and "HYPOL PLUS" (MDI).

Alternatively, the pad 12 can be made of a biodegradable material, such as a cellulose or cotton fiber. A polyurethane foam can also be used, being rendered biodegradable by hydrolysis of a weak backbone link, such as an amine group. Other foam materials, such as polyolefins, can be used and made hydrolytically biodegradable by using weak links such as starches in the polymer backbones.

The pad 12 includes a base 14 that has the general outline of a blunt arrowhead, as shown in Figure 2. In the first preferred embodiment of the invention, the base may be slightly concave, as shown in Figure 4. Alternatively, the base 14 can be made slightly convex, as shown in Figure 7, for those users who might find such a configuration more comfortable to wear. The base 14 has a concave posterior end 16, with lateral edges 18 that taper slightly toward each other as they extend toward a rounded anterior end 20. The anterior end 20 is thus somewhat narrower than the posterior end 16.

The pad is provided with an adhesive surface for retention against the floor of the vestibule. In this embodiment of the invention, the base is coated with an adhesive layer 22, comprising a pressure-sensitive, hydrophilic hydrogel adhesive material. Such hydrogel

adhesives are marketed by Promeon Division of Medtronic, Inc., of Minneapolis, Minnesota, under the trademark "PROMEON". A detailed description of such a hydrogel composition is contained in U.S. Patent No. 4,593,053 -
5 Jevne et al., the disclosure of which is incorporated herein by reference.

Another type of adhesive that has shown good results is a mixture of poly 2-hydroxyethyl methacrylate (PHEMA) and polyethylene glycol (PEG) as a plasticizer. The
10 percentage of PHEMA may range from about 45% to about 75%, with a corresponding range of PEG of about 55% to about 25%. The preferred composition is about 53% to 54% PHEMA and about 47% to 46% PEG. Lower percentages of PHEMA yield greater adhesiveness, while higher percentages of
15 PHEMA yield greater durability. The PEG has a molecular weight between about 400 and about 1000, with 400 preferred. The PHEMA is preferably a mixture of low molecular weight PHEMA (Mw between about 10,000 and about 100,000) and high molecular weight PHEMA (Mw greater than
20 about 100,000). The low Mw PHEMA provides adhesive properties, while the high Mw PHEMA improves adhesive structural integrity. The PHEMA mixture is between about 10% - 50% low Mw PHEMA and between about 90% and 50% high Mw PHEMA, with the precise mixture being determined by the
25 particular adhesive properties desired.

While the preferred plasticizer is PEG, as described above, other plasticizers can be used, such as propylene glycol, polypropylene glycol (PPG), or glycerin.

If the pad 12 is made of TDI or MDI, the material of
30 the pad itself can be rendered adhesive by combining the TDI or MDI one-to-one by weight with about 0.25 to 0.50 molar ammonium hydroxide during the water actuation of the foam. The resulting material has a surface that is

positively charged, so that it will adhere to a negatively-charged mucoid surface (such as the surface of the vestibule and the inner portions of the labia minora).

Alternatively, the entire pad can be formed of an adhesive, such as the PHEMA/PEG mixture described above.

The side of the pad 12 opposite the base 14 includes a central longitudinal stiffening ridge 26 which forms the thickest part of the pad 12. If one adopts the convention that the base is the "bottom" of the pad 12, then the pad can be defined as having a surface 27 opposite the base that slopes "downwardly" from either side of the ridge 26 toward the edges 18, so that there is a gradual reduction in pad thickness from the ridge to the edges. Viewed another way, the pad can be defined as having a cross-sectional shape that narrows from the base 14 to the "top" or apex 28 of the ridge 26. The resulting configuration is such that a lateral cross section of the pad, taken through the ridge 26, produces a shape resembling a triangle with rounded corners and slightly concave sides, as shown in Figure 6. Similarly, the ridge 26 has an anterior edge 30 that tapers "downwardly" from the apex 28 toward anterior end 20 of the pad 12, as shown in Figure 3, so that the anterior end 20 of the pad 12 is substantially reduced in thickness as compared to the posterior end 16.

The device 10 is advantageously provided with a handle or tab that is either integrally molded with the pad 12, or subsequently attached to it. In the first preferred embodiment, handle is a ring or loop 32, preferably of thread, that is inserted laterally through the pad 12. The loop is preferably located near the anterior edge 28 of the ridge 26, although the precise location of the loop 32 is not critical to its function,

as will be described below.

Figures 5 and 6 show the incontinence device 10 installed in the external genitalia of a human female. The device 10 is installed so that the base 14 is seated against the vestibule 34 of the vulva 36, anteriorly of the vaginal orifice 37, thereby occluding the urethral meatus 38. The adhesive surface seals the meatus sufficiently to prevent the escape of urine. The lateral edges 18 and the anterior end 20 of the pad are tucked under the labia minora 40. The engagement between the labia minora and the sloping surface 27 enhances the retention of the pad 12 in engagement with the vestibule 34. The concavity in the posterior end 16 of the pad 12 allows for somewhat greater surface area for engagement by the labia minora, while leaving a clearance for the vaginal opening 37. The ridge 26 extends into the interlabial space, and the loop 32 protrudes from between the labia majora (not shown), so as to be exposed to facilitate manual grasping, for removal of the device.

The pad 12 can be provided in a number of sizes to fit a large variety of individuals. The length of the pad should be approximately the same as the distance between the anterior lip of the vaginal orifice and the juncture of the labia minora. The width of the pad should optimally conform substantially to the width of the vestibule. Predetermined sizes can be trimmed individually for optimum fit. In some cases, a mold of the relevant portions of the vulva may be taken prior to sizing the pad.

The adhesive layer 22 not only provides a fluid-tight seal for the urethral meatus, but it also minimizes slippage of the device. The central ridge 26 lends rigidity that resists deformation of the pad and rupture

of the adhesive layer under fluid pressure from the urethra, thereby enhancing the fluid-tight seal provided by the pad against the urethral meatus. It may be advantageous to extend the adhesive layer onto the labia-
5 engaging surface 27, thereby further enhancing the stability of the device.

An incontinence device constructed in accordance with the first preferred embodiment of the invention, as described above, can be made to withstand short-term fluid
10 pressures from the urethra in the range of up to at least about 100, and preferably to about 170, centimeters of water without significant leakage. Pressures in this range are those that would typically result in involuntary urine voiding in cases of stress and urge incontinence,
15 with 170 centimeters of water being the approximate maximum bear-down pressure for a typical adult human female.

As an option, the foam material of the pad, and/or the adhesive surface, can be provided with a medically-
20 active composition. An antibacterial or germicidal agent, such as silver oxide or silver azide may be used, for example.

The first preferred embodiment lends itself to several modifications that may provide better comfort for
25 certain individuals. For example. Figures 8, 9, and 10 show a modified device 50, which includes a pad 52 of substantially uniform thickness, except for a longitudinal ridge 54. This modification provides lateral flaps 56 that flex more easily than those of the embodiment of
30 Figures 1-7 when engaged against the labia minora, thereby yielding a better conformal fit with the genitalia. Still greater flexibility may be provided by forming a longitudinal groove 58 in each of the flaps 56, on either

side of the ridge 54, as shown in Figures 11 and 12.

As still another option, a short protuberance 59 may be provided on the base, as shown in Figures 9 and 10. The protuberance 59 is dimensioned to be received wholly or partially within the urethral meatus, thereby facilitating proper placement of the device, and enhancing the occlusion of the meatus.

Another modification of the first preferred embodiment is shown in Figures 17, 18, and 19. As shown in these figures a modified device 60 includes a layer 62 of highly-absorbant hydrophilic material adjacent the adhesive layer 64 on the base of the pad. The hydrophilic layer 62 is preferably a mixture of the PHEMA/PEG adhesive and either a micro sponge material, such as carboxymethylcellulose (CMC) or a super-absorbant material, such as potassium polyacrylate. The hydrophilic layer 62 draws moisture from the adhesive layer 64 and absorbs the moisture, thereby prolonging the useful lifetime of the adhesive by delaying saturation. Absorption of moisture causes the hydrophilic layer 62 to swell, as shown in Figure 19, which may enhance the sealing properties of the device.

Still another modification of the first preferred embodiment is shown in Figures 20, 21 and 22. In these figures, a modified device 70 has a pad 72 having an integral longitudinal ridge 74. The ridge 74 has a finger hole 76 in its posterior edge. The finger hole 76 is normally in a collapsed state, as shown in Figure 20. It expands to receive the user's finger 78, as shown in Figure 22, to facilitate installation and removal.

In Figure 21, the device 70 is shown as having an adhesive layer 80 applied directly to the base of the pad 72, as previously described. Figure 23 shows still

another feature that can be incorporated, as a further modification, into any of the previously-described variations of the first preferred embodiment. In this variation or modification, a scrim layer 90 is enclosed within the adhesive 92 applied to the base of the pad. The scrim layer 90 is preferably a thin, non-woven sheet of polyester that can reinforce an elastomeric material. In the present invention, the scrim layer 90 adds structural integrity to the adhesive material, thereby enhancing the durability of the device. As shown in Figure 23, the scrim layer 90 is placed in the adhesive before the adhesive is cured to a semi-solid. Alternatively, the scrim layer 90 can be applied to the base of the pad before the adhesive is applied, in which case the scrim layer would be sandwiched between the adhesive and the base of the pad.

It has been noted that some potential users of the present invention have a relatively narrow vestibule floor. This type of anatomical structure is shown in Figure 16, which shows a simplified cross-sectional view of external female genitalia, wherein the vestibule floor 94 and the labia minora 96 define a relatively narrow space proximate the urethral meatus 98. For those with this type of anatomical structure, the above-described first preferred embodiment may be uncomfortable, or altogether unsuitable. Consequently, a second preferred embodiment, illustrated in Figures 13, 14, and 15, is contemplated for such users.

In accordance with this second preferred embodiment, a female urinary incontinence device 100 includes substantially tubular pad 102, substantially the entire exterior surface of which is coated with an adhesive 104, of a type described above. The pad 102 has a longitudinal

ridge 106, preferably not coated with the adhesive, that is used as a gripping element to facilitate installation and removal. As shown in Figures 13 and 14, the tubular pad may have a substantially elliptical cross-section.

- 5 Alternatively, as shown in Figure 15, a pad 102a, having a cross-sectional shape similar to a rounded triangle, may be more suitable for some users. Optionally, a protuberance (not shown), such as the protuberance 59 shown in Figures 9 and 10 and described above, can be
10 provided on this embodiment to facilitate proper placement and to enhance occlusion.

Figures 24 and 25 illustrate a third preferred embodiment of the invention. A urinary incontinence device 110, in accordance with this embodiment, includes a
15 thin, flexible sac or bladder 112, formed of polyurethane or a similar thin, resilient, flexible material. The sac 112 is filled with a suitable biocompatible liquid or gel 114 by means of a needle, and the needle hole is then sealed, thereby forming a compliant sac. A preferred
20 material for filling the sac is a hydrogel, similar the hydrogel adhesives described above. Substantially the entire exterior surface of the sac is coated with an adhesive 116, of a type described above.

In use, the device 110 is inserted under the labia
25 minora so as to be seated against the floor of the vestibule, occluding the urethral meatus. The sac conforms to the anatomical structure of the external female genitalia, filling the interlabial space, and sealing against the urethral meatus with the aid of the
30 adhesive. Because the sac is so compliant, it can be used for a wide variety of anatomical structures, providing high levels of comfort. The device may advantageously be provided with a raised tab 118, not coated with the

adhesive, to be gripped by the user, to facilitate the installation and removal of the device 110.

From the foregoing, the advantages of the present invention will be readily appreciated. The incontinence
5 device in accordance with the present invention provides effective management of female urinary incontinence, especially stress and urge incontinence, without the inconvenience and discomfort associated with prior art urine collection devices and absorbent pads. The present
10 invention is easy to use and comfortable to wear. It is easily shaped and sized to fit each individual user's anatomy with optimum effectiveness and comfort. Easily and inexpensively manufactured, the present invention can be made as a disposable item.

15 While several preferred embodiments and modifications thereof have been described above, it should be understood that still further modifications and variations will suggest themselves to those skilled in the pertinent arts. Such variations and modifications should be considered
20 within the spirit and scope of the invention, as defined in the claims that follow.

WHAT IS CLAIMED IS:

1. An incontinence device for managing urinary incontinence in a human female, comprising:
 - a body of biocompatible material adapted to fit
5 between the labia minora and the floor of the vestibule of the vulva of the human female, so as to occlude the urethral meatus; and
 - adhesive means on the body for providing a sealing engagement between the body and the urethral
10 meatus.
2. The device of Claim 1, wherein the body is a pad having a base that seats against the floor of the vestibule and a pair of lateral flaps that engage the labia minora, the lateral flaps being configured so as to
15 allow a substantial amount of flexing to conform to the anatomical structure of the external genitalia of the human female.
3. The device of Claim 2, wherein each of the lateral flaps has a longitudinal groove that increases the flexibility of the lateral flaps.
20
4. The device of Claim 1, wherein the body has a longitudinal ridge.
5. The device of Claim 4, wherein the longitudinal ridge has a posterior edge with a hole adapted to receive
25 a human finger.
6. The device of Claim 4, wherein the body is substantially tubular.
7. The device of Claim 6, wherein the body has a substantially elliptical cross-section.
8. The device of Claim 6, wherein the body has a
30 cross-section that is substantially in the form of a rounded triangle.
9. The device of Claim 1, wherein the body is a pad

having a base that seats against the floor of the vestibule, and a pair of lateral flaps that engage the labia minora of the human female, wherein the adhesive means includes a layer of adhesive material applied to the
5 base, the device further comprising:

a layer of highly-absorbant, hydrophilic material between the base of the pad and the layer of adhesive material.

10 10. The device of Claim 9, wherein the hydrophilic material includes potassium polyacrylate.

11. The device of Claim 9, wherein the hydrophilic material includes carboxymethylcellulose.

12. The device of Claim 9, wherein the hydrophilic material is a mixture of adhesive material and a material
15 selected from a group consisting of carboxymethylcellulose and potassium polyacrylate.

13. The device of Claim 1, wherein the body is substantially made of a biodegradable material.

14. The device of Claim 13, wherein the
20 biodegradable material is selected from a group consisting of cotton fiber, cellulose fiber, and a biodegradable polymeric foam.

15. The device of Claim 1, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of
25 poly 2-hydroxyethyl methacrylate and a plasticizer.

16. The device of Claim 15, wherein the plasticizer is selected from a group consisting of polyethylene glycol, propylene glycol, polypropylene glycol, and glycerin.

30 17. The device of Claim 1, wherein the body comprises a sac filled with a biocompatible liquid or gel material, and wherein the adhesive means includes a coating of adhesive material on the exterior surface of

the sac.

18. The device of Claim 1, wherein the body is a pad having a base that seats against the floor of the vestibule and a pair of lateral flaps that engage the labia minora, wherein the adhesive means includes a layer of adhesive material applied to the base, the device further comprising:

a layer of scrim material between the base and the layer of adhesive material.

19. The device of Claim 18, wherein the scrim material includes a thin sheet formed substantially from a polyester.

20. The device of Claim 1, further comprising:
a protuberance on the body dimensioned to be received at least partially within the urethral meatus.

21. The device of Claim 1, wherein the body and the adhesive means are formed substantially of a hydrogel comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer selected from a group consisting of polyethylene glycol, polypropylene glycol, propylene glycol, and glycerin.

22. An incontinence device for managing urinary incontinence in a human female, comprising:

a pad dimensioned and shaped for fitting between the labia minora and the vestibule and including a base and adhesive means on the base for sealing against and occluding the urethral meatus of the user, the pad being retained in place against the urethral meatus substantially by adhesion to the vestibule of the user, wherein the pad includes a pair of lateral flaps configured to engage the labia minora with a substantial amount of flexing so as to conform to the anatomical structure of the external genitalia.

23. The device of Claim 22, wherein each of the lateral flaps includes a longitudinal groove that increases the flexibility of the flaps.

24. The device of Claim 22, wherein the base
5 includes a protuberance dimensioned to be received at least partially within the urethral meatus.

25. The device of Claim 22, wherein the pad is made of a biodegradable material selected from a group consisting of cotton fiber, cellulose fiber, and
10 biodegradable polymeric foam.

26. The device of Claim 22, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer selected from a group consisting of polyethylene glycol,
15 polypropylene glycol, propylene glycol, and glycerin.

27. An incontinence device for managing urinary incontinence in a human female, comprising:

a pad dimensioned and shaped for fitting between the labia minora and the vestibule and including a base
20 and adhesive means on the base for sealing against and occluding the urethral meatus of the user, the pad being retained in place against the urethral meatus substantially by adhesion to the vestibule of the user, the pad including a longitudinal ridge with a posterior
25 edge having a hole adapted to receive a human finger.

28. The device of Claim 27, wherein the pad is made of a biodegradable material selected from a group consisting of cotton fiber, cellulose fiber, and biodegradable polymeric foam.

30 29. The device of Claim 27, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer selected from a group consisting of polyethylene glycol,

polypropylene glycol, propylene glycol, and glycerin.

30. An incontinence device for managing urinary incontinence in a human female, comprising:

5 a substantially tubular pad of resilient material adapted to fit between the labia minora and the floor of the vestibule of the vulva of the user, so as to occlude the urethral meatus; and

10 adhesive means on the pad for providing a sealing engagement between the pad and the urethral meatus.

31. The device of Claim 30, wherein the pad has a longitudinal ridge.

15 32. The device of Claim 30, wherein the pad is made of a biodegradable material selected from a group consisting of cotton fiber, cellulose fiber, and biodegradable polymeric foam.

20 33. The device of Claim 30, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer selected from a group consisting of polyethylene glycol, polypropylene glycol, propylene glycol, and glycerin.

34. An incontinence device for managing urinary incontinence in a human female, comprising:

25 a pad dimensioned and shaped for fitting between the labia minora and the vestibule and including a base and adhesive means on the base for sealing against and occluding the urethral meatus of the user, the pad being retained in place against the urethral meatus substantially by adhesion to the vestibule of the user, 30 wherein the adhesive means includes a layer of adhesive material applied to the base, the device further comprising:

a layer of highly-absorbant hydrophilic material

between the base of the pad and the layer of adhesive material.

35. The device of Claim 34, wherein the hydrophilic material includes potassium polyacrylate.

5 36. The device of Claim 34, wherein the hydrophilic material includes carboxymethylcellulose.

37. The device of Claim 34, wherein the hydrophilic material is a mixture of adhesive material and microsponge material selected from a group consisting of
10 carboxymethylcellulose and potassium polyacrylate.

38. The device of Claim 34, wherein the pad is made of a biodegradable material selected from a group consisting of cotton fiber, cellulose fiber, and biodegradable polymeric foam.

15 39. The device of Claim 34, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer selected from a group consisting of polyethylene glycol, polypropylene glycol, propylene glycol, and glycerin.

20 40. An incontinence device for managing urinary incontinence in a human female, comprising:

 a pad dimensioned and shaped for fitting between the labia minora and the vestibule and including a base and adhesive means on the base for sealing against
25 and occluding the urethral meatus of the user, the pad being retained in place against the urethral meatus substantially by adhesion to the vestibule of the user, wherein the adhesive means includes a layer of adhesive material applied to the base, the device further
30 comprising:

 a layer of scrim material between the base of the pad and the layer of adhesive material.

41. The device of Claim 40, wherein the scrim

material includes a thin sheet formed substantially from a polyester.

42. The device of Claim 40, wherein the pad is made of a biodegradable material selected from a group
5 consisting of cotton fiber, cellulose fiber, and biodegradable polymeric foam.

43. The device of Claim 40, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer
10 selected from a group consisting of polyethylene glycol, polypropylene glycol, propylene glycol, and glycerin.

44. An incontinence device for managing urinary incontinence in a human female, comprising:

a sac filled with a biocompatible liquid or gel
15 material so as to fit conformingly between the labia minora and the floor of the vestibule of the vulva of the human female, thereby occluding the urethral meatus of the user; and

adhesive means on the exterior surface of the
20 sac for providing a sealing engagement between the sac and the urethral meatus.

45. The device of Claim 44, wherein the adhesive means includes a hydrogel adhesive comprising a mixture of poly 2-hydroxyethyl methacrylate and a plasticizer
25 selected from a group consisting of polyethylene glycol, polypropylene glycol, propylene glycol, and glycerin.

46. A device for controlling urinary incontinence in a human female user, comprising:

a pad adapted to seal against and occlude the
30 urethral meatus of the user, and to be retained in place against the urethral meatus substantially by adhesion to the anatomical structure of the external genitalia of the user.

47. The device of Claim 46, wherein the pad comprises:

a base adapted to seat against the vestibule of the vulva of the user; and

5 adhesive means on the base, for sealing against and occluding the urethral meatus.

48. The device of Claim 46, wherein the pad is made of a biocompatible foam material.

49. The device of Claim 48, wherein the foam
10 material is formed from the water actuation of a prepolymer selected from the group consisting of toluene diisocyanate and methylene diphenyl diisocyanate.

50. The device of Claim 47, wherein the adhesive
15 means includes a pressure-sensitive hydrophylic hydrogel material applied to the base.

51. The device of Claim 47, wherein the pad is made of a foam material formed from the water actuation of a prepolymer selected from the group consisting of toluene diisocyanate and methylene diphenyl diisocyanate, and
20 wherein the adhesive means is formed by reacting the prepolymer with ammonium hydroxide during the water actuation thereof.

52. The device of Claim 46, further comprising:
handle means, operatively connected to the pad, for
25 facilitating the removal of the device from the user's external genitalia.

53. The device of Claim 47, wherein the pad includes a posterior end, an anterior end, and a pair of lateral edges converging toward the anterior end, and wherein the
30 base is dimensioned to seat against the vestibule anteriorly of the vaginal orifice of the user, inside the labia minora of the user, whereby the engagement between the labia minora and the pad contributes to the retention

of the base against the vestibule.

54. The device of Claim 53, wherein the pad includes a side opposite the base, the opposite side having a longitudinal ridge that extends into the interlabial space of the user.

55. The device of Claim 54, wherein the ridge has a longitudinal apex, and wherein the pad is shaped such that a lateral cross-section through the ridge narrows from the base to the apex.

56. The device of Claim 55, wherein the pad is shaped such that a lateral cross-section through the ridge has a substantially triangular shape with rounded corners and slightly concave sides.

57. The device of Claim 56, wherein the ridge has a tapered anterior edge, whereby the anterior end of the pad is substantially reduced in thickness as compared to the posterior end.

58. The device of Claim 54, further comprising a handle extending from the ridge, whereby the handle extends between the labia majora of the user when the base of the pad is seated against the vestibule.

59. A device for controlling urinary incontinence in a human female user, comprising;

a pad having a base adapted to be seated against the vestibule of the vulva of the user, so as to cover that portion of the vestibule anterior of the vaginal opening of the user, the pad having an anterior end, a posterior end, and a pair of lateral edges converging from the posterior end to the anterior end, the lateral edges and the anterior end of the pad being adapted to be tucked under the labia minora of the user; and

adhesive means on the base for providing a fluid-tight seal against the urethral meatus of the user;

whereby the seating engagement of the base against the vestibule is substantially maintained by the adhesive engagement between the vestibule and the pad.

60. The device of Claim 59, further comprising a
5 handle attached to the pad so as to extend between the labia majora of the user when the base is seated against the vestibule.

61. The device of Claim 59, wherein the pad is formed of a resilient foam material.

10 62. The device of Claim 61, wherein the foam material is formed from the water actuation of a prepolymer selected from the group consisting of toluene diisocyanate and methylene diphenyl diisocyanate.

63. The device of Claim 59, wherein the pad includes
15 a medically-active composition.

64. The device of Claim 59, wherein the pad includes a side opposite the base, the opposite side having a longitudinal ridge that extends into the interlabial space of the user.

20 65. The device of Claim 64, wherein the ridge has a longitudinal apex, and wherein the pad is shaped such that a lateral cross-section through the ridge narrows from the base to the apex.

66. The device of Claim 65, wherein the pad is
25 shaped such that a lateral cross-section through the ridge has a substantially triangular shape with rounded corners and slightly concave sides.

67. The device of Claim 66, wherein the ridge has a tapered anterior edge, whereby the anterior end of the pad
30 is substantially reduced in thickness as compared to the posterior end.

68. The device of Claim 59, wherein the adhesive means includes a hydrogel adhesive applied at least to the

base of the pad.

69. The device of Claim 62, wherein the adhesive means is provided by reacting the prepolymer with ammonium hydroxide during the water actuation thereof.

5 70. A device for controlling urinary incontinence in a human female user, comprising:

 a pad having a base adapted to be seated against the vestibule of the vulva of the user, so as to cover that portion of the vestibule anterior of the vaginal
10 opening of the user, the pad having an anterior end, a posterior end, and a pair of lateral edges converging from the posterior end to the anterior end, the lateral edges and the anterior end of the pad being adapted to be tucked under the labia minora of the user;

15 a surface on the pad opposite the base, the surface forming a longitudinal ridge that extends into the interlabial space of the user when the base is seated against the vestibule;

20 adhesive means on the base for providing a fluid-tight seal against the urethral meatus of the user; and

 handle means, attached to the ridge so as to extend between the labia majora of the user when the base is seated against the vestibule, for facilitating removal
25 of the device by the user.

71. The device of Claim 70, wherein the pad is made from a foam material formed from the water actuation of a prepolymer selected from the group consisting of toluene diisocyanate and methylene diphenyl diisocyanate.

30 72. The device of Claim 70, wherein the adhesive means comprises a hydrogel adhesive material applied at least to the base of the pad.

73. The device of Claim 71, wherein the adhesive

means is formed by reacting the prepolymer with ammonium hydroxide during the water actuation thereof.

74. The device of Claim 70, wherein the ridge has a longitudinal apex, and wherein the pad is shaped such that
5 a lateral cross-section through the ridge narrows from the base to the apex.

75. The device of Claim 74, wherein the pad is shaped such that a lateral cross-section through the ridge has a substantially triangular shape with rounded corners
10 and slightly concave sides.

76. The device of Claim 75, wherein the ridge has a tapered anterior edge, whereby the anterior end of the pad is substantially reduced in thickness as compared to the
posterior end.

V. ☐ OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE

This international search report has not been established in respect of certain claims under Article 17(2) (a) for the following reasons:

1. ☐ Claim numbers _____ because they relate to subject matter not required to be searched by this Authority, namely:

2. ☐ Claim numbers _____ because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out i.e. specifically:

3. ☐ Claim numbers _____ because they are dependent claims not drafted in accordance with the second and third sentences of PCT Rule 8.4(a).

VI. ☐ OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING

This International Searching Authority found multiple inventions in this international application as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims of the international application.

2. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims of the international application for which fees were paid, specifically claims:

3. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:

4. ☐ As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

Remark on Protest

☐ The additional search fees were accompanied by applicant's protest.

☐ No protest accompanied the payment of additional search fees.
